

Synopsis

March 2023 began with a strong winter storm that brought over a foot of snow to the northern mountains and wind gusts in excess of 60 mph to the eastern plains. Then there was a period of dry and seasonably warm weather accompanied by critical fire weather conditions in eastern New Mexico. Around the middle of the month, a train of Pacific storms brought rounds of heavy mountain snow and lower elevation rain and snow to western and central New Mexico. Like most of the winter, eastern New Mexico missed out on most of the moisture and got gusty winds instead. The month ended with another big storm that brought strong winds and mountain snow.
